To Whom It May Concern,

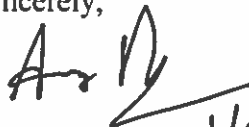

This letter is in support of David Tan. David has taken the Data Structures course I taught at Valdosta State University. In that course, David received a B.

David has a good background in Mathematics and Computer Science. David has good programming skills in Java and he demonstrated that in the Data Structures course. Clear in writing and effective in coding, David can communicate technical topics with ease.

David has worked under my mentorship in a research project last summer (Blazer Summer Research Institute). I can explain to you first-hand about David's project work. David worked on fault containment algorithms of distributed systems. The algorithm David implemented helped restore the legitimate configurations of the system in single fault scenarios using a randomized scheduler. Furthermore, he conducted simulation experiments. The simulation results give an insight into the efficiency of our algorithm. Variations in the number of nodes and the degree of faulty node are some of the factors that have been taken into account in the experiments.

The above BSRI project has been completed. David has also presented posters on this research at multiple venues. The interaction with the audience and handling of QA sessions successfully speak of David's communication skills.

Sincerely,

1/21/2022

Dr. Anurag Dasgupta
Associate Professor
Department of Computer Science
Valdosta State University, GA
